

Auralis Dynamics

Quarterly operations review

This review covers fleet growth, regional deployment, and the service architecture for the Atlas platform. Figures in this document are illustrative and describe a fictional company.

The fleet expanded across every region during the year, with the strongest single quarter driven by three large logistics sites coming online together. Support load per robot fell as the fleet grew, which the operations team attributes to the remote diagnostics rollout.

Page two charts the quarterly fleet figures. Page three lists the regional breakdown and service tiers. Page four shows how a task moves through the scheduling stack.

At a glance

Deployed robots grew through the year across four regions. Exact quarterly values are in the chart on page two.

Fleet growth by quarter

Deployed robots, end of quarter

Robots per site averaged 20 at year end.

The Nordics region opened in Q3.

Regional deployment and service tiers

End of Q4

Region	Sites	Robots	Service tier	Response
Central Europe	38	760	Scale	4 hours
Nordics	12	240	Scale	8 hours
Iberia	21	410	Growth	next day
United Kingdom	21	440	Growth	next day

Scale sites carry a four hour response commitment.

Growth sites are next business day.

How a task reaches a robot

Scheduling stack, simplified

A task never skips the scheduler, which is what keeps two robots from being sent to the same aisle.

Throughput against battery charge

Pallets moved per hour, averaged across the fleet

Sustained work above 80 percent charge is rare because the fleet scheduler holds robots back for opportunity charging.

The vertical axis is deliberately unlabelled in this draft.
